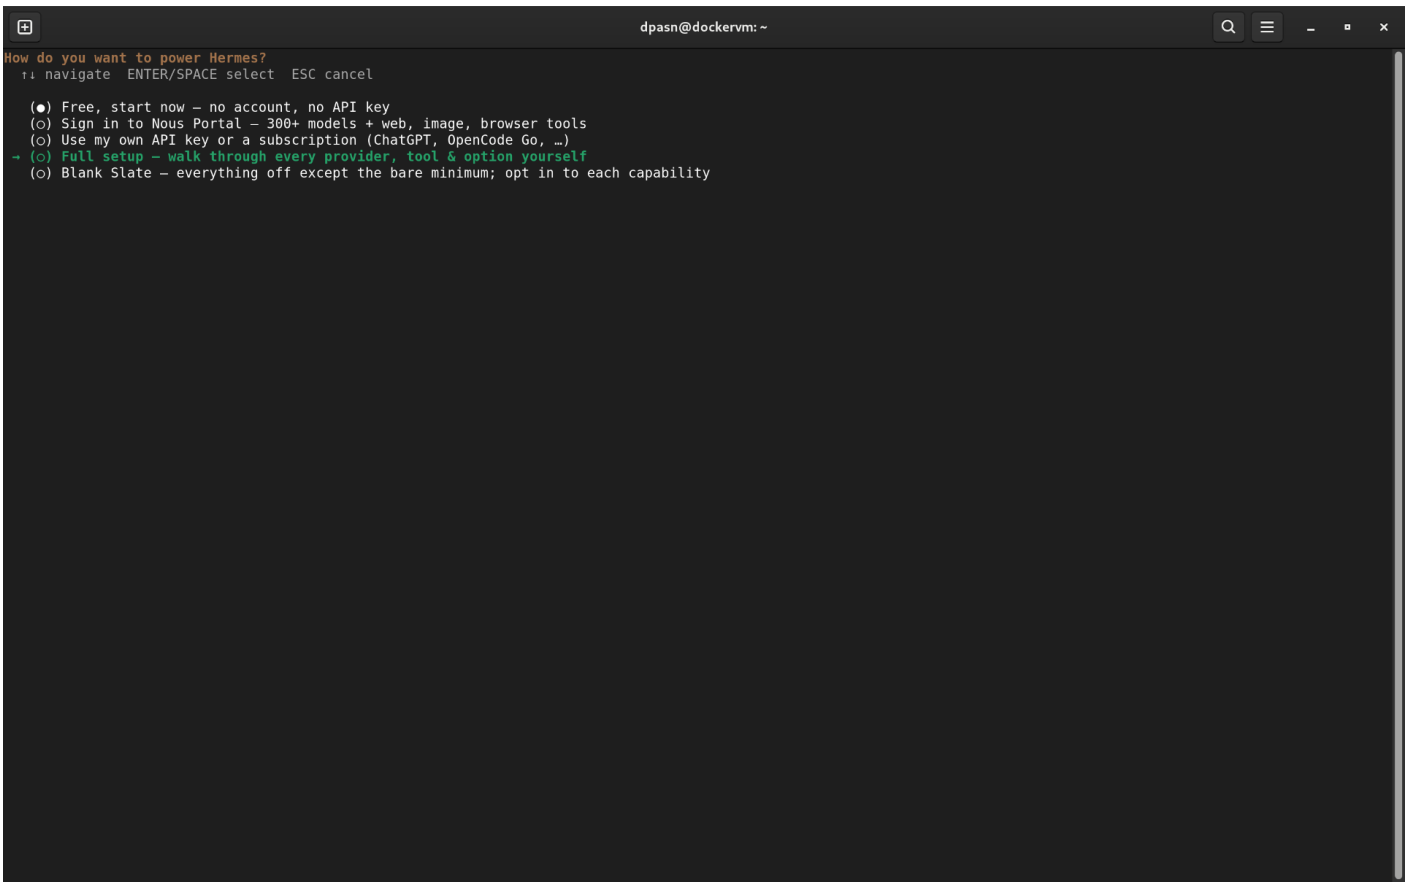
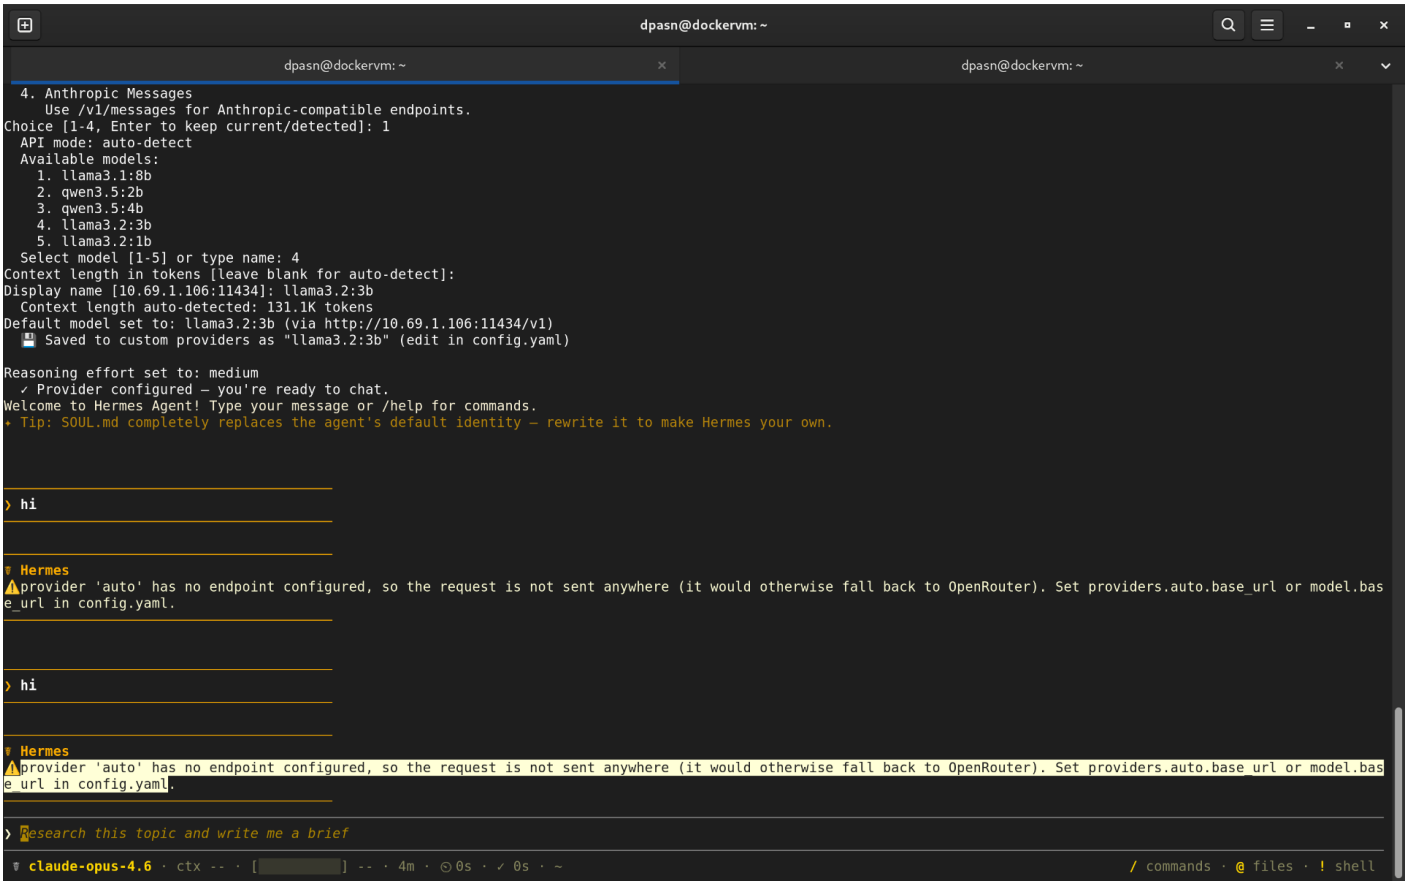
Docker Deployment

This Docker deployment is a bit different than usual since we won't be simply deploying a docker compose file as we are used to. Instead we use the official installation scrip to install Hermes on your VM.



Error: provider 'auto' has no endpoint configured, so the request is not sent anywhere (it would otherwise fall back to OpenRouter). Set providers.auto.base_url or model.base_url in config.yaml



I just needed to exit and renter again and it worked

Then when I wanted to search the web I got this error

The website ai.deternet.org is currently down. The web_extract tool encountered an error and was unable to retrieve content from the URL. The error message suggests that the web_extract tool is currently set to use DuckDuckGo as its backend, but it is not configured to extract URL content. To resolve this issue, you may need to adjust the web_extract tool's configuration to use a different backend or set of tools.

Extract URL Content

1. *Firecrawl*
2. *SearchXNG*

- Hermes does not automatically search just because a question is absent from its training data. You must configure the backend as described above for it to utilize web search capabilities.
- Ensure that the selected provider supports the features you need, such as extraction or crawling, depending on your use case.

Do I need a Firecrawl API key?

No, but web access is limited without one. Firecrawl is the default web backend, and Hermes agent auto-uses it whenever FIRECRAWL_API_KEY is present. Other search providers exist, but Firecrawl is the only one that covers the full range of web actions: search, single-page scraping, and multi-page crawling
