User Management

To provide access to models for users in Open WebUI, you can use role-based access control (RBAC) to assign specific permissions to user roles, allowing them to access and manage the models as needed. You can restrict models to specific users or groups, ensuring that only authorized users can see and use certain models.

If you want one of your users to use a specific model than you can set a model to public. If you have set it to public all people with an account on your instance will have access to that model as well.
